EXECUTIVE SUMMARY

Cloud & DevOps professional driving cloud architecture, platform modernization, and AI initiatives across AWS and Azure. Experienced in solution design, automation, Kubernetes, DevSecOps, and cloud-native platforms. Combines hands-on engineering with technical leadership and stakeholder engagement to deliver scalable, secure, resilient solutions that create business value across teams.

CERTIFICATION

- AWS Certified Sys Ops Administrator - Associate
- AWS Certified Machine Learning Engineer - Associate

SKILLS OVERVIEW

- AWS API Gateway
- AWS Elastic Container Service
- AWS Redis
- Azure APIM
- Azure Blob Storage
- Azure Function Apps
- Azure Key Vault
- Azure Kubernetes Services
- Azure Logic Apps
- AWS SQS
- AWS DynamoDB
- AWS RDS
- AWS Route53
- AWS Transit Gateway
- AWS VPC
- Terraform
- AWS CloudFormation
- AWS CodeBuild
- AWS CodePipeline
- Github
- Gitlab
- Jenkins
- Docker
- AWS IAM
- Python
- Kubernetes
- AWS Athena
- AWS Aurora
- AWS CloudFront
- AWS Cognito
- AWS Elastic Container Registry
- AWS Elastic Kubernetes Service
- AWS KMS
- AWS EventBridge
- Pulumi
- AWS ECS/EKS (EC2/Fargate)
- Azure FrontDoor
- Azure Active Directory (AAD)
- Azure API Gateway
- Azure API Management
- Argo CD

TECHNICAL SKILLS

- Cloud Providers - AWS , Microsoft Azure
- Container Orchestration : Kubernetes (EKS, AKS), Docker , Rancher
- Infrastructure & Configuration Management: AWS CloudFormation, Terraform, Pulumi, AWS CDK, Azure Bicep, Terragrunt
- CI/CD - GitHub Actions, Jenkins,ArgoCD (ApplicationSets), Git-based deployment workflows, AWS Code Pipeline
- Networking & Hybrid Connectivity: AWS VPC Design, Transit Gateway, Direct Connect, Azure VNet Hub-Spoke, Azure Virtual WAN
- Security & Identity: AWS IAM, IRSA (Pod Identity), AWS KMS, Azure AD (Entra ID), Azure Key Vault
- Programming Language - Python, Typescript, C, C++

RELEVANT EXPERIENCE

Jun 2026 Onwards
Lead Engineer
Financial Services

AWS to Azure Migration And Modernization

- Leading end-to-end cloud discovery and migration assessment activities for enterprise workloads across multiple AWS accounts, taking ownership of stakeholder discovery calls, technical requirement gathering, application assessments, and migration scope identification.
- Architected and developed a Python-based AWS discovery framework using boto3, automating multi-region and multi-account infrastructure inventory across compute, networking, storage, databases, containers, security, messaging, and data platform services.
- Designed and implemented application dependency discovery tooling to map EC2 workloads against networking, storage, IAM, load balancers, security groups, KMS, and other infrastructure components, enabling application-level dependency analysis and migration wave planning.
- Engineered advanced network discovery and visualization capabilities, including multi-hop Security Group traffic analysis, VPC connectivity, Transit Gateway, Direct Connect, VPN, peering, and endpoint mapping, generating architecture diagrams and structured network documentation.
- Led application-level technical assessments across multiple business-critical platforms, documenting existing architectures, application integrations, infrastructure dependencies, runtime requirements, and migration constraints to determine appropriate migration and modernization strategies.
- Driving AWS-to-Azure solution architecture and migration planning by evaluating existing AWS services, identifying Azure target-service equivalents, defining infrastructure requirements, and developing As-Is / To-Be architecture designs and Low-Level Design (LLD) documentation.
- Developed automated assessment and reporting solutions that generate structured Excel inventories, dependency graphs, Azure service-mapping workbooks, and architecture documentation, significantly reducing manual discovery effort and improving the consistency of migration deliverables.
- Providing technical leadership and architectural guidance to a team of engineers, distributing discovery and assessment activities, reviewing technical outputs, mentoring team members, and aligning engineering execution with migration objectives.
- Collaborating with client stakeholders, application owners, architects, and program teams to validate technical requirements, resolve discovery gaps, assess migration risks, and translate business requirements into actionable technical migration plans.

Dec 2025 to Jun 2026
Senior Engineer
iGaming Industry

Cloud Native Platform Modernization

- Led the modernization of high-frequency event processing systems by migrating 30+ Python-based microservices from AWS Lambda to Amazon EKS, overcoming serverless limitations related to execution time, cold starts, and concurrency constraints.
- Designed and implemented a resilient event-driven architecture transitioning from direct DynamoDB Stream triggers to an EventBridge Pipes SQS EKS consumer pattern, significantly improving throughput, fault

isolation, and processing reliability

- Established a GitOps-driven deployment model using ArgoCD ApplicationSets and Helm, enabling automated multi-environment and multi-cluster deployments with centralized configuration control and zero-drift consistency.
- Engineered a modular Helm chart repository and standardized microservice “Blueprints” framework, defining Dockerization standards, directory structures, and production-ready FastAPI runtimes across 30+ services.
- Strengthened cluster security posture by implementing AWS Pod Identity and IAM Roles for Service Accounts (IRSA), eliminating long-lived credentials and enforcing least-privilege access controls.
- Enhanced production resilience and elasticity using Kubernetes-native constructs including KEDA-based event-driven autoscaling (SQS triggers), Horizontal Pod Autoscalers (HPA), Pod Disruption Budgets (PDB), and Secrets Store CSI Drivers to ensure high availability and efficient workload scaling.
- Driving real-time platform modernization by leading the migration of WebSocket services to EKS, consolidating compute layers and enabling low-latency, horizontally scalable user interaction systems.
- Designed and optimized enterprise CI/CD pipelines using Jenkins for multi-environment container delivery workflows across development, staging, and production environments on Amazon EKS.
- Re-architected existing image build pipelines from a redundant “build in every environment” approach to a Build Once, Promote Forward model, significantly reducing duplicate image builds, improving deployment consistency, and accelerating release cycles.
- Implemented automated container promotion workflows leveraging Buildah, Amazon ECR, Trivy security scanning, GitOps repository updates, and commit SHA/version-based image tagging to ensure traceable and secure software delivery.
- Standardized environment promotion pipelines where development pipelines perform centralized image build and vulnerability scanning, while staging and production pipelines securely promote pre-validated container images through retagging and controlled deployment automation.
- Integrated Jenkins-based CI/CD workflows with ArgoCD-driven GitOps deployments, enabling automated environment synchronization, reduced deployment drift, and improved operational governance across Kubernetes clusters.

Hybrid Cloud Migration and DevOps Transformation

- Led cloud modernization and migration of 15+ enterprise applications, consolidating 30+ on-prem workloads into AWS-native architectures while preparing 80+ additional systems for future migration phases, while also supporting hybrid connectivity patterns spanning AWS and Azure environments.
- Standardized IaC provisioning by implementing Terraform, Terragrunt, Atlantis workflows, and Azure Bicep templates, reverse-engineering legacy infrastructure and establishing fully automated GitHub-driven deployment pipelines across multi-cloud environments.
- Architected multi-tier AWS VPC and Azure Hub-Spoke networks across environments, defining subnets, routing, Direct Connect/VPN, Azure VWAN, and ingress/egress via ALB/NLB, App Gateway, and Front Door, aligned with enterprise security, scalability, and hybrid connectivity standards.
- Contributed to hybrid disaster recovery planning and cross-cloud resilience strategies, aligning AWS-native backup patterns with Azure DR capabilities to support business continuity and compliance mandates.
- Developed a multi-account EBS re-encryption framework using Step Functions and Lambda, enabling automated

KMS key rotation, drift detection, and audit-grade reporting across distributed EC2 fleets.

- Strengthened cloud posture by automating platform baselines and driving remediation initiatives through AWS Well-Architected Reviews and Azure governance best practices, addressing gaps in tagging, backups, security controls, and operational governance.
- Defined reusable Terraform modules and Azure Bicep templates for network, compute, and shared services provisioning across development, QA, UAT, and production environments, ensuring consistency and eliminating configuration drift.
- Collaborated closely with the Program Management Office to shape and drive the migration roadmap, aligning architectural direction, risk visibility, and milestone-based delivery across multi-cloud landscapes.
- Authored comprehensive architecture references, runbooks, SOPs, and MOPs, establishing governance standards for IaC, networking, lifecycle management, API exposure via Azure API Management, and post-migration validation.
- Eliminated significant manual effort by automating re-encryption, Windows upgrade flows, and environment provisioning, reducing operational workload by nearly 80% across teams.

Senior Engineer
Travel-Hospitality-Entertainment

Rancher-Based Bare Metal Kubernetes Implementation

- Designed and deployed an air-gapped Kubernetes cluster on bare metal infrastructure using Rancher and MetalLB, optimizing cost by leveraging on-prem hardware.
- Orchestrated k8s management cluster creation and inter-cluster node migration, including master-to-worker role conversion, to enhance infrastructure flexibility.
- Implemented GitOps practices for downstream cluster provisioning, enabling scalable and declarative cluster management.
- Delivered detailed operational runbooks for reproducibility and long-term maintenance in an environment with no external cloud dependency.
- Achieved streamlined cluster operations while overcoming challenges related to hardware failure management and networking without cloud provider support.
- Addressed key strategic goals such as cost optimization, regulatory compliance, and vendor lock-in avoidance.

Nov 2023 to Jul 2024
Devops Engineer
Asset Management

AWS Migration

- Engineered scalable infrastructure leveraging AWS CloudFormation, employing IaC for consistent and automated deployments.
- Executed migration of multiple VMs to AWS using MGN, enhancing operational efficiency and cloud integration.
- Automated S3 bucket migration to a new AWS account using Python, enhancing efficiency and data transfer integrity.
- Deployed key agents (DR, CloudWatch, AWS Inspector, Windows Server) on application servers via SSM Documents for improved monitoring and security.
- Executed large-scale EC2 snapshot migration to a new account with a Python script, bolstering disaster recovery and data accessibility.

- Configured a disaster recovery plan for all applications using AWS Elastic Disaster Recovery to ensure business continuity.
- Assumed responsibility for cost optimization, focusing on efficient resource management and expense reduction.
- Leveraged AWS Cost Optimizer and its APIs to develop an automated system that generated comprehensive reports on the costs associated with various AWS resources.
- Created an automation that identified unutilized EC2 volumes and snapshots, as well as volumes attached to stopped instances, ensuring that unnecessary resources were terminated.
- The implemented automations resulted in significant cost savings, reducing monthly expenses by approximately $200.

Sep 2023 to Nov 2023
Senior Devops Engineer
Healthcare Industry

Implementation of MFA for Enhanced Security

- Developed and tested IAM user listing and MFA status check functions for enhanced security.
- Automated account population and MFA enforcement across multiple accounts, improving security.
- Implemented scripts for MFA enforcement and rollback, including testing.
- Created immutable policies and SCP to secure MFA, preventing unauthorized changes.
- Developed and deployed CloudFormation stack for MFA policy, streamlining security processes.
- Crafted IAC scripts for deployment, handed over scripts and documentation for operational use.
- Enhanced DynamoDB MFA status table for better data management, ensuring unique user IDs.
- Authored design documentation and rollback automation for MFA, ensuring system resilience.
- Assisted in enforcing MFA for 240 users and tested rollback automation, bolstering security.

Apr 2023 to Aug 2023
Devops Engineer
Educational Sector

AWS Infrastructure to Facilitate Course Delivery

- Utilized Pulumi IaC to automate and manage cloud infrastructure, leveraging TypeScript for scripting.
- Addressed the challenge of limited Pulumi documentation by conducting proof of concept (POC) projects, which enhanced understanding and skill.
- Developed scalable and resilient infrastructure for a content delivery application to ensure efficient performance under varying loads.
- Implemented the Elastic Container Registry (ECR) replication process to manage Docker container images across different environments effectively.
- Worked on Amazon ElastiCache, focusing on deployment and failover mechanisms to improve application performance and ensure availability during outages
- Refactored the Pulumi infrastructure code for better configurability and reusability, tailoring it to different environmental requirements.
- Acquired foundational knowledge of BlazeMeter for performance testing applications.

Nov 2022 to Mar 2023
Devops Engineer
IT Consulting

Implement AWS Environment

- Transitioned the complete Terraform codebase to Terragrunt, including the Terraform state.
- Utilized Chef and OpsWorks for configuration management.
- Enabled connectivity across regions and with on-premises networks via AWS Transit Gateway.
